

PRODUCT INFORMATION SHEET

SPCXplorer
Statistical Process Control
Software

Email: tms.sales@torus-group.com
www.torus-group.com

The new “SPCXplorer” SPC (Statistical Process Control) software package from Torus Measurement Systems has been developed for today’s 32bit Windows platform.

Using Industry standard database platforms, SPCXplorer is suitable for single station application, through to full factory “database-centric” network installations.

Designed with the needs of shop-floor data collection in mind, SPCXplorer can be interfaced to a large variety of manual instrumentation via RS232 connectivity, or for more complex gauging systems, can process bespoke ASCII data files via Ethernet.

The Reporting module ensures the data is displayed in the right format for your quality reviews, and with its simple and powerful administration functions, access to the management and configuration areas of the software is password protected for assured security.

With our database migration tools and backward compatibility architecture, users of the previous generation Repro2000 can upgrade with minimal disruption to their daily operation.
